

WHAT IS CLAIMED IS:

1. A driver's information system, comprising:

5 a user interface module comprising at least one component, a state of which can be changed by a manipulation of a user, the user interface module being configured to determine a state of the component;

a function module configured to receive user input from said interface module and comprising at least one execution command signal generating unit for generating
10 execution command signals; and

a control unit configured to receive the execution command signal from the function module and to actuate various devices responding to the execution command signal.

15 2. The driver's information system of claim 1, further comprising plural components wherein at least two of the components are interconnected with each other such that if a state of one of the interconnected components is determined, states of other interconnected components are automatically determined.

20 3. The driver's information system of claim 2, wherein when the states of the other interconnected components are automatically determined by the determination of the one component, the function module simultaneously generates execution command signals corresponding to the determined states of the interconnected components.

25 4. The driver's information system of claim 1, wherein the components of the user interface module comprise a static component, an input component, and an output component.
